Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5 Glycosyltransferases (AAR91311-15) are products of the lgt locus (AAR14061) of Neiserria gonorrhoeae strain F62. Glycosyltransferase LgtA (AAR91311) can be obtd. by expression of the lgtA coding sequence in recombinant host cells. A method for adding GalNAC or GlcNAc betal-3 to Gal comprises contacting a reaction mixture contg. activated GalNAc or GlcNac to an acceptor moiety comprising a Gal residue in the presence of LgtA. Oligosaccharides can be produced that, when attached to non-toxic lipids, are useful for Neisseria vaccine prepn. Blood group core oligosaccharides, and mimics of lacto-N-neotetraose, gangliosides and saccharide portions of globoglycollpids can also be produced using the enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 8; Fig

It is the first PGTase reported to be capable of transfer of more than one different saccharide moiety. The PGTase is encoded by nucleotides 445-1488 of a lipo-oligosaccharide gene (AAT49230). It can be produced in transformed host cells and used oligosaccharida.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transfer of at least 2 saccharide units using poly:glycosyl:transferase - isolated from N. gonorrhoeae, catalyses the addition of both GlcNac and GalNac di:saccharide(s) units to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-PSDB; AAT49230

(I) and (II) are useful in the manufacture of a medicament for treating or preventing a condition (e.g., meningitis) associated with infection by Neisseria or Gram-negative bacteria. The product is useful for veterinary treatment and in a screening assay for the identification of an antimicrobial drug. The vaccines have prophylactic applications. AAU72911-AAU73014 represent N. meningitidis virulence proteins of the invention
